A greeting card has separate healthcare or home healthcare-related information for the card recipient and the card giver. Preferably, the card recipient is a person recovering from a serious illness or is someone that is chronically ill while the card giver is the card recipient's home healthcare provider or caregiver. Preferably, the information provided is relevant to a specific medical illness or condition, or relevant to the home healthcare of the elderly. Furthermore, the card giver's information may be provided to the card giver/caregiver in a more straightforward manner since the caregiver has a need to know the seriousness of the medical condition/illness while the card recipient may not have the mental or emotional fortitude to accept the serious nature or outcome of the card recipient's medical illness/condition at that stage of the medical illness'/condition's progression. Other embodiments of this information delivery system are also described.
